

Lab_4_VibeCoding...
PDF

help me with the project start from task 1 give me command for vibe coding agent to do my work

Yes. I checked your assigned repo **SETAPESU26/17_wordle** and the Lab 4 handout.

Your assignment specifically says to inspect the existing code, fix **Task 1 first**, test it, and keep a separate commit for each task. Lab_4_VibeCoding_Student_handout

For your repo, **Task 1 is duplicate-letter feedback**: exact matches must be resolved first, and each target letter can satisfy only one guessed occurrence. GitHub

Step 1 — Before using the agent

Clone your assigned repo:

Bash

```
git clone https://github.com/SETAPESU26/17_wordle.git
cd 17_wordle
python main.py
```

Important: First record the required **10-second before video**, showing the existing duplicate-letter bug. The README specifically asks you to reproduce the defect before changing code. GitHub

---

Step 2 — Give this exact prompt to your Vibe Coding agent

Paste this as your **first prompt**:

Plain text

```
I am working on an individual Vibe Coding lab assignment. Do NOT rewrite the whole project or replace it wit

Repository: 17_wordle
This is a terminal-based Python Wordle game.
```

```
I need you to work ONLY on TASK 1 for now.

TASK 1 — Correct duplicate-letter feedback

Requirement:
Implement standard Wordle-style feedback in which:
1. Exact-position matches are resolved first.
2. Each occurrence of a letter in the target word can satisfy AT MOST ONE occurrence of that letter in the g
3. Remaining guessed letters should be classified as present only when an unused matching letter remains in
4. All other letters should be classified as absent.
5. Existing project structure and coding style should be preserved.
6. Do not add external dependencies.
7. Do not add CSV, JSON, SQLite, databases, files, or any persistence.
8. Do not modify Tasks 2, 3, or 4 yet.
9. Make the smallest clean change necessary, preferably in feedback.py
```

What should happen

The agent should mainly modify **`feedback.py`**. Your repo README describes that file as the letter-evaluation logic, while `game.py` handles the game loop/history. GitHub

The important algorithm is:

Plain text

```
PASS 1
Check every position:
    if guess[i] == target[i]:
        GREEN / EXACT
        consume that target letter

PASS 2
For every remaining guess letter:
    if an unused copy exists in target:
        YELLOW / PRESENT
        consume that copy
    else:
        GRAY / ABSENT
```

This prevents the classic bug where a target containing only one `A` incorrectly marks two or three guessed `A`s as present.

Step 3 — After the agent finishes

Run:

Bash

```
python main.py
```

Then inspect the changes:

Bash

```
git diff
```

If everything is correct, make **Task 1's separate commit**:

Bash

```
git add feedback.py
git commit -m "Fix duplicate letter feedback"
```

The lab explicitly requires separate commits for each task. Lab_4_VibeCoding_Student_handout

Don't push yet if you haven't checked the code.

Then we can do **Task 2** → **Task 3** → **Task 4**, each with a carefully designed Vibe Coding prompt and separate commit.

Your assigned GitHub repository ↗

next what?

Worked for 10s

You have successfully pushed your code to your personal GitHub repo. ✅

But there is **one important issue** in your screenshot:

Plain text

```
git add .
```

caused **2 files to be included in the same commit**, and one of them is:

```
Plain text
__pycache__/feedback.cpython-314.pyc
```

Also, your commit message says:

```
Plain text
Fix duplicate-letter feedback and add game features
```

That suggests the agent may have changed more than just Task 1. Since your lab requires **separate commits for each task**, don't start Task 2 yet. The handout explicitly requires separate commits for each task. Lab_4_VibeCoding_Student_handout

First, run these commands

```
cmd
git show --stat --oneline HEAD
```

Then:

```
cmd
git show --name-only --oneline HEAD
```

Send me the output/screenshots.

I want to verify exactly what went into your first commit before we proceed.

Also don't use this anymore

```
cmd
git add .
```

From now on, use:

```cmd
git add filename.py
```

so only the task-specific file gets committed.

One more thing

Your current GitHub push is fine:

```Plain text
DarshanDoddamani2006/17_wordle
```

That matches the requirement that you push to your **personal account** rather than the main `SETAPESU26` repository. Lab_4_VibeCoding_Student_handout

Send me the output of:

```cmd
git show --stat --oneline HEAD
git show --name-only --oneline HEAD
```

and I'll tell you **exactly what command to run next** so we don't mess up your task-wise commits.

if correct then task 2 please

Yes — **Task 1 is already pushed**, and your `git show` confirms the commit contains `feedback.py` plus an unwanted `__pycache__` file. The functionality itself is in `feedback.py`, so we can move on.

According to the actual repository README, **Task 2 is:**

> Add clean win/loss handling, enforce the six accepted-guess limit, and ensure invalid guesses do not consume a turn. GitHub

Give your Vibe Coding agent this exact prompt

Plain text

```
We are now working ONLY on TASK 2 of the Wordle assignment.

TASK 2 — Complete guess handling

Requirements from README:
1. Add clean win handling.
2. Add clean loss handling.
3. Enforce a maximum of 6 ACCEPTED guesses.
4. Invalid guesses must NOT consume a turn.
5. Keep the existing Task 1 duplicate-letter feedback logic unchanged.
6. Do not implement Task 3 or Task 4 yet.
7. Do not rewrite the entire project.
8. Do not add external dependencies.
9. Do not add CSV, JSON, SQLite, databases, files, or any persistence.
10. Keep all state in memory.
11. Preserve the existing terminal-based interface as much as possible.

Before changing anything:
- Inspect main.py, game.py, feedback.py, and words.py.
- Explain how the current game loop handles guesses and turns.
```

Then, after the agent finishes

Run:

cmd

```
git diff
```

Then:

cmd

```
python main.py
```

Test at least:

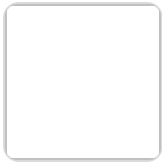

- win immediately
- win on 6th valid guess
- 6 wrong valid guesses

- invalid guess followed by valid guess

Once we confirm Task 2 is correct, **do not use `git add .`**. Also, before the next commit, we should clean up the `__pycache__` tracking so your submission doesn't carry generated `.pyc` files.

The README specifically requires testing invalid inputs, winning on the final allowed guess, losing, and quitting. GitHub

Send me the Vibe Coding agent's output after you run that prompt, and I'll give you the exact **Task 2 commit + push commands**.

next what?

This looks like **Task 2 changes are ready in `game.py`**, and they are **not committed yet**. Good. 👍

The only other changes shown are Python cache files:

```
Plain text

__pycache__/game.cpython-314.pyc
__pycache__/words.cpython-314.pyc
```

Do not stage those.

1. Test Task 2 now

Run:

```
cmd

python main.py
```

Test these scenarios:

```
Plain text

1. Enter an invalid guess, such as:
abc

2. Then enter valid guesses.
```

```
3. Make 6 valid wrong guesses.
   The game should stop after the 6th accepted guess.

4. On another run, guess the correct word.
   It should say "Solved!" and stop immediately.
```

The key thing we are checking is that **invalid guesses do not consume one of the 6 attempts**.

2. After testing, check status

Run:

```cmd
git status
```

You should see `game.py` modified, plus possibly the `__pycache__` files.

3. Commit ONLY `game.py`

Do **not** use `git add .`.

Use:

```cmd
git add game.py
git commit -m "Improve guess handling and game termination"
```

Then:

```cmd
git push origin main
```

Important

Your Task 2 commit should contain:

```Plain text
game.py
```

and **not**:

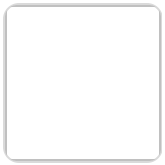

Plain text

```
__pycache__/game.cpython-314.pyc
__pycache__/words.cpython-314.pyc
```

The lab requires separate commits for each task, so keeping `game.py` isolated here is important.

Lab_4_VibeCoding_Student_handout

Run `python main.py` first and send me the result/screenshot. Then I'll take you directly to **Task 3**.

!check this!

Yes, I checked it. ✅ Your status is exactly what we expect **before the Task 2 commit**:

Plain text

```
modified: game.py
modified: __pycache__/game.cpython-314.pyc
modified: __pycache__/words.cpython-314.pyc
```

So **only `game.py` should be committed**. The two `__pycache__` files are generated Python cache files and should not go into your Task 2 commit.

Run these commands now

cmd

```
git add game.py
git status
```

After `git status`, you should see:

Plain text

```
Changes to be committed:
    modified: game.py

Changes not staged for commit:
    modified: __pycache__/game.cpython-314.pyc
    modified: __pycache__/words.cpython-314.pyc
```

Then commit:

```cmd
git commit -m "Improve guess handling and game termination"
```

Then push:

```cmd
git push origin main
```

After pushing, verify

```cmd
git status
```

You should see your branch up to date with `origin/main`, while the cache files may still appear as local modifications. **That's okay for now.**

The lab requires separate commits for each task, so this keeps Task 2 separate from Task 1.

Lab_4_VibeCoding_Student_handout

Send me the output after `git commit` and `git push`, and I'll give you the **Task 3 Vibe Coding prompt**.

next task!

Yes. Task 2 is pushed successfully:

Plain text

```
fda40f3 -> d4b162a
```

Your working tree only has the generated `__pycache__` changes, so **Task 2 itself is clean and pushed**.

Task 3 — Variable word lengths

The repo README says Task 3 requires **4-, 5-, and 6-letter modes**, using the supplied in-memory word list, with the existing feedback logic working for all three lengths. GitHub

Paste this **exact prompt** into your Vibe Coding agent:

Plain text

```
We are now implementing ONLY TASK 3.

TASK 3 — Variable word lengths

Requirement from README:
- Add 4-, 5-, and 6-letter modes using the supplied in-memory words.
- The existing feedback logic must work correctly for all supported lengths.

IMPORTANT RULES:
1. Do NOT modify or undo Task 1 duplicate-letter scoring.
2. Do NOT modify the Task 2 win/loss behavior except where required to support variable lengths.
3. Do NOT implement Task 4 yet.
4. Do NOT rewrite the whole project.
5. Do NOT add external dependencies.
6. Do NOT add CSV, JSON, SQLite, databases, or any persistence.
7. Keep all game state in memory.
8. Preserve the terminal-based design and existing project structure.
9. Make the smallest clean changes necessary.

FIRST inspect:
- main.py
```

The README explicitly lists **4-, 5-, and 6-letter modes** for Task 3 and says the feedback logic must work for all supported lengths. GitHub

After the agent finishes

Run:

cmd

```
git diff
```

Then:

cmd

```
python main.py
```

Test the three modes.

Do not commit yet. Send me the Vibe Coding agent's response/diff, and I'll check whether Task 3 is correct before giving you the Task 3 commit commands.

next?

If your Vibe Coding agent has finished **Task 3** and the tests passed, do this next.

1. Check exactly what changed

cmd

```
git status
```

Then:

cmd

```
git diff --stat
```

2. Run the game once

cmd

```
python main.py
```

Verify that you can select:

Plain text

```
1. 4 letters
2. 5 letters
```

```
3. 6 letters
```

and that the selected length is actually enforced.

3. Important: don't use `git add .`

Once confirmed, stage **only the Task 3 source files** shown by `git status`.

For example, if it shows `game.py` and `main.py`:

```cmd
git add game.py main.py
```

Then verify:

```cmd
git status
```

You should **not** stage anything under:

```Plain text
__pycache__\
```

4. Commit Task 3 separately

```cmd
git commit -m "Add variable word length modes"
```

Then:

```cmd
git push origin main
```

Finally:

cmd

```
git status
```

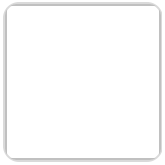

Your history should now look approximately like:

Plain text

```
Task 1 → Fix duplicate-letter feedback
Task 2 → Improve guess handling and game termination
Task 3 → Add variable word length modes
```

The assignment explicitly requires a separate commit for each task. Lab_4_VibeCoding_Student_handout

Send me the `git status` output after Task 3. I'll check it and then give you the **Task 4 prompt**.

based on this what next?

Yes — based on this `git status`, **Task 3 changes are in `game.py` and `words.py`**. The two `__pycache__` files are generated files and should **not** be committed.

The assignment requires a separate commit for each task. Lab_4_VibeCoding_Student_handout

Do this now

First, quickly inspect only the Task 3 changes:

cmd

```
git diff -- game.py words.py
```

If the diff looks like the 4/5/6-letter mode changes you expected, run:

cmd

```
git add game.py words.py
```

Check:

cmd

```
git status
```

It should show:

Plain text

```
Changes to be committed:
    modified: game.py
    modified: words.py

Changes not staged for commit:
    modified: __pycache__/game.cpython-314.pyc
    modified: __pycache__/words.cpython-314.pyc
```

Then commit:

cmd

```
git commit -m "Add variable word length modes"
```

Push:

cmd

```
git push origin main
```

Finally:

cmd

```
git status
```

You should see:

Plain text

```
Your branch is up to date with 'origin/main'.
```

Your commits should now be

Plain text

```
Task 1 → Fix duplicate-letter feedback
Task 2 → Improve guess handling and game termination
Task 3 → Add variable word length modes
```

Don't stage the `__pycache__` files.

After the push succeeds, send me the output of `git log --oneline -3`, and I'll give you the **Task 4 prompt**.

next what?

You're ready for **Task 4**, and now we have the exact README requirement:

> **Task 4 — Guess history and summary:** display a readable history after each accepted guess and provide a final session summary; invalid attempts must not create duplicate history entries. GitHub

Give your Vibe Coding agent this exact prompt

Plain text

```
We are now implementing ONLY TASK 4.

TASK 4 — Guess history and final summary

README requirement:
"Display a readable history after each accepted guess and provide a final session summary.
Do not duplicate entries for invalid attempts."

IMPORTANT:
- Do NOT modify the core duplicate-letter algorithm from Task 1.
- Do NOT break the 6 accepted-guess limit and win/loss handling from Task 2.
- Keep 4-, 5-, and 6-letter modes from Task 3.
- Do NOT add Task 5 or any feature not requested.
- Do NOT rewrite the project.
- Do NOT add external dependencies.
- Do NOT add CSV, JSON, SQLite, databases, or any persistent storage.
- Keep all state in memory.
- Preserve the current terminal-based interface and project structure.

FIRST inspect:
- README.md
```

When the agent finishes

Run:

```cmd
git diff
```

Then:

```cmd
python main.py
```

Do **not** commit immediately.

Send me the `git diff` output or screenshot. I'll check that Task 4 actually satisfies the README before you make the **fourth separate commit**. The README also requires testing invalid lengths, all three word lengths, winning on the final allowed guess, losing, and quitting. GitHub

Your final task structure should be:

```Plain text
Task 1 → duplicate-letter feedback
Task 2 → guess handling / 6 attempts
Task 3 → 4/5/6-letter modes
Task 4 → guess history + final summary
```

And remember: **don't use `git add .`**.

```

```

next what?

Your **Task 4 code looks correct from the diff**. ✅

It now:

- records history only after an accepted guess
- displays history after every accepted guess
- gives a final summary for win/loss/quit
- keeps invalid guesses out of history
- uses `len(self.history)` for accepted guesses

That matches the lab requirement for task-wise changes and separate commits.

Lab_4_VibeCoding_Student_handout

Now test Task 4

Run:

```cmd
python main.py
```

Check these:

Test 1 — Win

Enter the correct word immediately. You should see:

```
Plain text
History:
  Attempt 1: XXXXX -> ...
--- Game Summary ---
Result: Won
```

Test 2 — Invalid + valid

Enter an invalid-length/non-letter guess first, then a valid guess.

The invalid guess should **not** appear in History and should **not** increase `Guesses used`.

Test 3 — Loss

Enter 6 valid incorrect guesses.

You should get:

```
Plain text
Result: Lost
The word was: ...
```

with exactly 6 history entries.

Test 4 — Quit

Enter:

```
Plain text
q
```

The summary should show:

```
Plain text
```

```
Result: Quit
```

If those tests pass, commit Task 4

Do **not** use `git add .`.

Run:

```cmd
git status
```

Then stage only the source file:

```cmd
git add game.py
```

Check:

```cmd
git status
```

You should see `game.py` under **Changes to be committed**. Leave any `__pycache__` files unstaged.

Then:

```cmd
git commit -m "Add guess history and final summary"
```

and:

```cmd
git push origin main
```

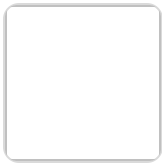

Finally:

cmd

```
git log --oneline -4
```

You should have four task commits.

Send me the output of `git log --oneline -4` ; then I'll help you do the **final Lab-4 submission cleanup** (videos, exported chat history, and Lab-4 folder structure).

how is it?

It looks **good**. ✅ Task 4 is behaving as intended in this test.

Your output confirms:

- **4-letter mode works**
- Accepted guesses are recorded in history
- History is shown after each accepted guess
- Correct guess immediately ends the game
- Final summary appears
- `Guesses used: 2/6` is correct
- Final history contains exactly the 2 accepted guesses
- The target word is revealed on win

So this test is strong evidence that Task 4 is working.

One thing still needs testing

You should also test an **invalid guess** before committing, because the assignment specifically requires invalid attempts not to create duplicate history entries. Lab_4_VibeCoding_Student_handout

Run:

cmd

```
python main.py
```

Choose `4` , then enter something invalid such as:

Plain text

```
abc
```

Then enter a valid 4-letter word.

You should see that:

Plain text

```
abc
```

does **not** appear in History and does **not** increase the attempt count.

After that, test `q` once as well.

Then commit Task 4

cmd

```
git status
```

Stage only:

cmd

```
git add game.py
```

Then:

cmd

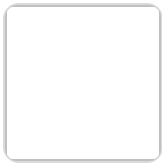

```
git commit -m "Add guess history and final summary"
git push origin main
```

Finally:

cmd

```
git log --oneline -4
```

At that point, you should have your 4 task commits ready.

now?

You're done with the **four coding tasks**. ✅ Your Git history now shows four separate commits:

```
Plain text
bd78191  Add guess history and final summary      ← Task 4
68b49fd  Add variable word length modes           ← Task 3
d4b162a  Improve guess handling and termination   ← Task 2
fda40f3  Fix duplicate-letter feedback...         ← Task 1
```

And the latest push succeeded:

```
Plain text
main -> main
```

Do these final checks

Run:

```
cmd
git status
```

Then:

```
cmd
git diff --check
```

`git diff --check` should ideally produce **no output**.

One cleanup

Your earlier screenshots showed generated Python cache files:

```
__pycache__/game.cpython-314.pyc
__pycache__/words.cpython-314.pyc
```

Don't commit them. You can clean their local modifications with:

```cmd
git restore __pycache__/game.cpython-314.pyc
git restore __pycache__/words.cpython-314.pyc
```

Then:

```cmd
git status
```

Now prepare your Lab-4 submission

The handout requires these under your **Lab-4 folder**:

```
Lab-4/
├── Before.mp4
├── After.mp4
├── Updated_Code/
└── Chat_History.pdf
```

The required deliverables are explicitly **before/after videos, updated code, and exported chat history as a doc/PDF**. Lab_4_VibeCoding_Student_handout

For the **After.mp4**, record around 10 seconds showing the completed Wordle working, ideally including the 4/5/6-letter selection and a successful game result.

For **Updated_Code**, include your Python source files, especially:

```
main.py
game.py
```

```
feedback.py
words.py
```

Don't include `__pycache__` .

For **Chat_History.pdf**, export/save the Vibe Coding agent conversation showing the prompts and changes for Tasks 1–4.

One final proof command

Run:

```cmd
git log --oneline --decorate -4
```

Take a screenshot of that too. It is useful evidence that you made **separate commits for each task**, which the lab requires. Lab_4_VibeCoding_Student_handout

After `git status` and `git diff --check` , you're essentially ready for submission.
